

Assignment 15

BST Balancing Using DFS

Build the BST structure, then for the next Tree, perform the following procedures to make it **balanced**:

1. Extract the **BST** into a **Vector** using **DFS Algorithm with in-order traversal**.
2. Clear the existing BST.
3. Reinsert the elements from the **Vector** back into the **BST** using a **recursive approach (Similar to Merge Sort Algorithm)**.

The balanced tree should match the next tree:
